University of Debrecen
Faculty of Science and Technology
Institute of Physics

PHYSICS BSC PROGRAM

2024

TABLE OF CONTENTS

DEAN`S WELCOME

Welcome to the Faculty of Science and Technology!

This is an exciting time for you, and I encourage you to take advantage of all that the Faculty of Science and Technology UD offers you during your bachelor's or master's studies. I hope that your time here will be both academically productive and personally rewarding

Being a regional centre for research, development and innovation, our Faculty has always regarded training highly qualified professionals as a priority. Since the establishment of the Faculty in 1949, we have traditionally been teaching and working in all aspects of Science and have been preparing students for the challenges of teaching. Our internationally renowned research teams guarantee that all students gain a high quality of expertise and knowledge. Students can also take part in research and development work, guided by professors with vast international experience.

While proud of our traditions, we seek continuous improvement, keeping in tune with the challenges of the modern age. To meet the demand of the job market for professionals, we offer engineering courses with a strong scientific basis, thus expanding our training spectrum in the field of technology. Based on the fruitful collaboration with our industrial partners, recently, we successfully introduced dual-track training programmes in our constantly evolving engineering courses.

We are committed to providing our students with valuable knowledge and professional work experience, so that they can enter the job market with competitive degrees. To ensure this, we maintain a close relationship with the most important national and international companies. The basis for our network of industrial relationships are in our off-site departments at various different companies, through which market participants - future employers - are also included in the development and training of our students.

Prof. dr. Ferenc Kun
Dean

UNIVERSITY OF DEBRECEN

Date of foundation: 1912 Hungarian Royal University of Sciences, 2000 University of Debrecen

Legal predecessors: Debrecen University of Agricultural Sciences; Debrecen Medical University; Wargha István College of Education, Hajdúböszörmény; Kossuth Lajos University of Arts and Sciences

Number of Faculties at the University of Debrecen: 13

Faculty of Agricultural and Food Sciences and Environmental Management

Faculty of Child and Special Needs Education

Faculty of Dentistry

Faculty of Economics and Business

Faculty of Engineering

Faculty of Health

Faculty of Humanities

Faculty of Informatics

Faculty of Law

Faculty of Medicine

Faculty of Music

Faculty of Pharmacy

Faculty of Science and Technology

Number of students at the University of Debrecen: 30,899

Full time teachers of the University of Debrecen: 1,597

210 full university professors and 1,262 lecturers with a PhD.

FACULTY OF SCIENCE AND TECHNOLOGY

The Faculty of Science and Technology is currently one of the largest faculties of the University of Debrecen with about 2,500 students and more than 200 staff members. The Faculty has got 6 institutes: Institute of Biology and Ecology, Institute of Biotechnology, Institute of Chemistry, Institute of Earth Sciences, Institute of Physics and Institute of Mathematics. The Faculty has a very wide scope of education dominated by science and technology (12 Bachelor programs and 14 Master programs), additionally it has a significant variety of teachers' training programs. Our teaching activities are based on a strong academic and industrial background, where highly qualified teachers with a scientific degree involve student in research and development projects as part of their curriculum. We are proud of our scientific excellence and of the application-oriented teaching programs with a strong industrial support. The number of international students of our faculty is continuously growing (currently ~ 760 students). The attractiveness of our education is indicated by the popularity of the Faculty in terms of incoming Erasmus students, as well.

THE ORGANIZATIONAL STRUCTURE OF THE FACULTY

Dean: Prof. Dr. Ferenc Kun, Full Professor
E-mail: ttkdekan@science.unideb.hu

Vice Dean for Educational Affairs: Prof. Dr. Gábor Kozma, Full Professor
E-mail: kozma.gabor@science.unideb.hu

Vice Dean for Scientific Affairs: Prof. Dr. Sándor Kéki, Full Professor
E-mail: keki.sandor@science.unideb.hu

Consultant on External Relationships: Prof. Dr. Attila Bérczes, Full Professor
E-mail: berczesa@science.unideb.hu

Consultant on Talent Management Programme: Prof. dr. Tibor Magura, Full Professor
E-mail: magura.tibor@science.unideb.hu

Dean's Office
Head of Dean's Office: Mrs. Katalin Kozma-Tóth
E-mail: toth.katalin@science.unideb.hu

English Program Officer: Mrs. Alexandra Csatáry
Address: 4032 Egyetem tér 1., Chemistry Building, A/101, E-mail: acsatary@science.unideb.hu

DEPARTMENTS OF INSTITUTE OF PHYSICS

Department of Experimental Physics (Debrecen, Bem tér 18/a)

Name	Position	E-mail
Mr. Dr. Gyula Zilizi, PhD, habil	Associate Professor, Head of Department	zilizi@science.unideb.hu
Mr. Prof. Dr. Zoltán Trócsányi, PhD, habil, DSc, Member of HAS	University Professor	zoltan.trocsanyi@science.unideb.hu
Mr. Dr. István Nándori, PhD, habil	Associate Professor	nandori.istvan@science.unideb.hu
Mr. Dr. István Csarnovics, PhD, habil	Assistant Professor	csarnovics.istvan@science.unideb.hu
Mr. Dr. Sándor Egri, PhD	Assistant Professor	egris@science.unideb.hu
Mr. Dr. László Oláh, PhD	Assistant Professor	olah.laszlo@science.unideb.hu
Mr. Roland Szatmári	Assistant Lecturer	szatmari.roland@science.unideb.hu
Mr. Dr. Kardos Ádam, PhD	Assistant Professor	kardos.adam@science.unideb.hu
Mr. Dr. László Viktor Tóth, PhD, DSc	Scientific Advisor	l.viktor.toth@science.unideb.hu

Department of Theoretical Physics (Debrecen, Bem tér 18/b)

Name	Position	E-mail
Ms. Prof. Dr. Ágnes Vibók, PhD, habil, DSc	University Professor, Head of Department	vibok.agnes@science.unideb.hu
Mr. Prof. Dr. Ferenc Kun, PhD, habil, DSc, Member of HAS	University Professor	sandor.nagy@science.unideb.hu
Mr. Dr. Sándor Nagy, PhD, habil	Associate Professor	ferenc.kun@science.unideb.hu
Mr. Dr. András Csehi, PhD, habil	Associate Professor	csehi.andras@science.unideb.hu
Mr. Prof. Zsolt Gulácsi, PhD, habil, DSc	University Professor	zsolt.gulacsi@science.unideb.hu
Mr. Dr. Zsolt Schram, PhD habil	Associate Professor	schram@science.unideb.hu
Mr. Dr. Gergő Pál, PhD	Assistant Professor	pal.gergo@science.unideb.hu
Mr. Dr. Peter Badanko, PhD	Assistant Professor	badanko.peter@science.unideb.hu

Department of Solid State Physics (Debrecen, Bem tér 18/b)

Name	Position	E-mail
Mr. Prof. Dr. Zoltán Erdélyi, PhD, habil, DSc	University Professor, Head of Department	zoltan.erdelyi@science.unideb.hu
Mr. Dr. Lajos Daróczi, PhD, habil	Associate Professor	lajos.daroczi@science.unideb.hu
Mr. Dr. Gábor Katona, PhD	Assistant Professor	gabor.katona@science.unideb.hu
Mr. Dr. Csaba Cserháti, PhD, habil, DSc	University Professor	cserhati.csaba@science.unideb.hu
Mr. Dr. János Tomán, PhD	Assistant Professor	janos.toman@science.unideb.hu
Mr. Dr. László Tóth, PhD	Assistant Professor	toth.laszlo@science.unideb.hu
Ms. Dr. Petra Pál, PhD	Assistant Professor	pal.petra@science.unideb.hu
Mr. Lajos Harasztosi	Teacher of engineering	lajos.harasztosi@science.unideb.hu

Department of Electric Engineering (Debrecen, Bem tér 18/a)

Name	Position	E-mail
Mr. Prof. Dr. Gábor Battistig, PhD, habil, DSc	University Professor, Head of Department	battistig.gabor@science.unideb.hu
Mr. Dr. János Kósa, PhD	Assistant Professor	kosa.janosarpad@science.unideb.hu
Mr. Dr. Sándor Misák, PhD	College Associate Professor	misak@science.unideb.hu
Mr. Árpád Rácz	Assistant Lecturer	racz.arpad@science.unideb.hu
Ms. Dr. Réka Trencsényi, PhD	Assistant Professor	trencsenyi.reka@science.unideb.hu
Mr. Berta Korcsmáros	Teacher of engineering	korcsmaros.berta@science.unideb.hu
Ms. Dr. Kósáné Kalavé Enikő	Teacher of engineering	kalave.eniko@science.unideb.hu
Mr. Zsolt Markovics	Teacher of engineering	markovics.zsolt@science.unideb.hu
Mr. Péter Kovács	Teacher of engineering	kovacs.peter@science.unideb.hu
Mr. András Mucsi	Teacher of engineering	mucsi.andras@science.unideb.hu
Mr. Zsolt Szabó	Teacher of engineering	szabo.zsolt@science.unideb.hu

Department of Enviromental Physics (Debrecen, Bem tér 18/c)

Name	Position	E-mail
Mr. Dr. István Csige, PhD, habil	Associate Professor head of department	csige@science.unideb.hu
Ms. Dr. Eszter Baradács, PhD, habil	Associate Professor	baradacs@science.unideb.hu
Mr. Dr. Zoltán Papp, PhD, habil	Associate Professor	zpapp@science.unideb.hu

ACADEMIC CALENDAR

General structure of the academic semester (2 semesters/year):

Study period	1st week	Registration*	1 week
	2nd – 14th week	Teaching period	13 weeks
Exam period	directly after the study period	Exams	6-7 weeks

*Usually, registration is scheduled for the first week of September in the fall semester, and for the first week of February in the spring semester.

For further information please check the following link:

THE PHYSICS BACHELOR PROGRAM

Information about the Program

Name of BSc Program:	Physics BSc Program
Specialization available:	no specialization
Field, branch:	Science
Qualification:	Physicist
Mode of attendance:	Full-time
Faculty, Institute:	Faculty of Science and Technology Institute of Physics
Program supervisor:	Prof. Dr. Zoltán Erdélyi, University Professor
Program coordinator:	Dr. Gábor Katona, Assistant Professor
Duration:	6 semesters
ECTS Credits:	180

Objectives of the BSc program:

The aim of the Physics BSc program is to train professional physicists who have deep insight into physical processes. Relying on strong mathematics and informatics foundations, graduates of the program will be able to understand physical phenomena, apply physical theories, principles and laws, and to develop solutions based on applied science.

Professional competences to be acquired

A Physicist:

a) Knowledge:

- He/she has knowledge of the general and specialized principles, laws and possible applications of mathematics and informatics.
- He/she has knowledge of the physical theories and models based on scientific results.
- He/she is aware of the possible directions and limits of the development of Physics.
- He/she has knowledge of the fundamentals of the natural sciences as well as the practices based on this knowledge and has the ability to systematize them.
- He/she has knowledge regarding practical applications, laboratory works, methods, and tools, and could apply them and use them in his profession on a basic level.
- He/she has the knowledge needed to apply his field to solve practical problems related to natural processes, natural resources, living and inanimate system.
- He/she has the knowledge of the concepts and terminology of physics.
- He/she has the necessary knowledge to analyse the processes, systems, scientific problems in ways which are acceptable in current scientific practice.

b) Abilities:
- He/she has the ability to understand the physical phenomena, its data collection, processing and analysis, and the use of basic literature needed for these activities.
- He/she has the ability to apply physical theories, principles, and laws.
- He/she has the ability based on his or her knowledge of the field of physics to produce simple physical phenomena under laboratory conditions, to demonstrate and test them.
- He/she has the ability to evaluate, interpret and document of results of measurements.
- He/she has the ability to identify issues in the relevant field of expertise.
- He/she has the ability to apply the knowledge of physics to solve basic practical problems, including the ability to support this with calculations.
- He/she has the ability to plan and organize the physics-based part of development processes.
- He/she has the ability to collect and interpret relevant data based on his or her field, and based on this, can formulate a relevant opinion on social, scientific or ethical issues.
- He/she has the ability, on the basis of the physical knowledge, to use science-based argumentation.
- He/she has the ability to increase his or her knowledge and continue studies at a higher level.

c) Attitude:
- He/she tries to get to know the relationship between nature and man.
- During the practical and laboratory work he/she behaves in an environmentally conscious way.
- He/she is open to a professional exchange of views.
- He/she open to professional cooperation with specialists working in the field of social policy, economy, and environmental protection.
- He/she knows the example of the debating and incredulous natural scientist
- He/she authentically represents the scientific worldview and can convey it to a professional and non-professional audience.
- He/she is open to the direction of natural scientific and non-natural scientific advanced studies.
- He/she is committed to acquiring new competencies and expanding the scientific worldview, develops and deepens their professional knowledge

d) Autonomy and responsibility:
- He/she is capable of independently considering the basic professional issues and then answers them based on credible sources.
- He/she takes responsibility for the scientific world view.
- He/she takes responsibility in cooperation with a specialist in natural sciences and other fields.
- He/she consciously undertakes the ethical standards of a professional physicist.
- He/she evaluates the results of his own work in a realistic way.
- He/she evaluates the work of a subordinate employee responsibly.
- He/she is aware of the importance and consequences of scientific statements.
- He/she independently operates the laboratory equipment and tools used in research.

Completion of the BSc Program

The Credit System

Majors in the Hungarian Education System have generally been instituted and ruled by the Act of Parliament under the Higher Education Act. The higher education system meets the qualifications of the Bologna Process that defines the qualifications in terms of learning outcomes: statements of what students know and can do on completing their degrees. In describing the cycles, the framework uses the European Credit Transfer and Accumulation System (ECTS).
ECTS was developed as an instrument of improving academic recognition throughout the European Universities by means of effective and general mechanisms. ECTS serves as a model of academic recognition, as it provides greater transparency of study programs and student achievement. ECTS in no way regulates the content, structure and/or equivalence of study programs.
Regarding each major the Higher Education Act prescribes which professional fields define a certain training program. It contains the proportion of the subject groups: natural sciences, economics and humanities, subject-related subjects and differentiated field-specific subjects.

During the program students have to complete a total amount of 180 credit points. It means approximately 30 credits per semester. The curriculum contains the list of subjects (with credit points) and the recommended order of completing subjects which takes into account the prerequisite(s) of each subject. You can find the recommended list of subjects/semesters in chapter “Guideline”.

Model Curriculum of Physics BSc Program

	Semesters						ECTS credit points	Evaluation
	1.	2.	3.	4.	5.	6.		
	contact hours, types of teaching (l – lecture, p – practice), credit points							
Compulsory physics subject groups								
Bases of arts and sciences subject group								
Mathematics in physics *Erdélyi Zoltán*	1 l + 3 p /4 cr						4	mid-semester grade
Basics of measurement and evolution *Katona Gábor*	2 p / 2 cr						2	mid-semester grade
Basic environmental science *Nagy Sándor Alex*					1 l /1 cr		1	exam
Introduction to electronics subject group								
Laboratory Practicals in Electronics *Oláh László*				2 l / 3 cr	2 p / 2 cr		3+2	exam mid-semester grade
Mathematics subject group								
Mathematics I *Muzsnay Zoltán*	4 l / 6 cr 4 p / 4 cr						6+4	exam mid-semester grade
Mathematics II *Muzsnay Zoltán*		4 l / 5 cr 2 p / 2 cr					5+2	exam mid-semester grade
Mathematics III *Figula Ágota*			2 l / 3 cr 2 p / 2 cr				3+2	exam mid-semester grade
Bases of mechanics subject group								
Classical mechanics 1. *Nándori István*	4 l / 6 cr 2 p / 3 cr						6+3	exam mid-semester grade
Basic Computer Skills in Physics subject group								
Basic Computer Skills in Physics *Tomán János*		1 l + 2 p / 2 cr					2	mid-semester grade
Laboratory practical: mechanics, optics, thermodynamics 1 *Katona Gábor*		2 p / 2 cr					2	mid-semester grade

Laboratory practical: mechanics, optics, thermodynamics 2 *Katona Gábor*			2 p / 2 cr				2	mid-semester grade
Thermodynamic subject group								
Thermodynamics *Trócsányi Zoltán* *Darai Judit*		4 l / 6 cr 2 p / 3 cr					6+3	exam mid-semester grade
Advanced mechanics subject group								
Classical mechanics 2. *Nagy Sándor*		2 l / 3 cr 2 p / 3 cr					3+3	exam mid-semester grade
Electromagnetism and optics subject group								
Optics *Dr. Csarnovics István*		1 l / 1 cr 1 p / 1 cr					1+1	exam mid-semester grade
Electromagnetism *Trócsányi Zoltán* *Daróczi Lajos*			4 l / 6 cr 2 p / 3 cr				6+3	exam mid-semester grade
Electrodynamics subject group								
Electrodynamics *Vibók Ágnes*				2 l / 3 cr 2 p / 3 cr			3+3	exam mid-semester grade
Condensed matters 1.subject group								
Condensed matters 1. *Cserháti Csaba*			2 l / 3 cr 2 p / 2 cr				3+2	exam mid-semester grade
Condensed matters 2. *Erdélyi Zoltán*					2 l / 3 cr 2 p / 2 cr		3+2	exam mid-semester grade
Condensed Matter Lab. Practices 1 *Cserháti Csaba*				2 p / 2 cr			2	mid-semester grade
Atomic, Nuclear and quantum physics subject group								
Atomic and quantum physics *Nándori István*				2 l / 3 cr 1 p / 2 cr			3+2	exam mid-semester grade
Nuclear physics *Darai Judit*					2 l + 1 p / 4 cr		4	exam
Atomic and nuclear physics laboratory work 1 *Ujvári Balázs*					2 p / 2 cr		2	mid-semester grade

Quantum Mechanics and Fundamental interactions subject group								
Quantum Mechanics 1 *Nagy Sándor*					3 l / 4 cr 2 p / 3 cr		4+3	exam mid-semester grade
Fundamental interactions *Nándori István*						2 l + 2 p / 4 cr	4	exam
Statistical physics subject group								
Statistical physics *Kun Ferenc*						3 l / 5 cr 2 p / 3 cr	5+3	exam mid-semester grade
Advanced mathematics subject group								
Linear algebra *Gaál István*			2 l / 3 cr 2 p / 2 cr				3+2	exam mid-semester grade
Probability and statistics *Muzsnay Zoltán*			2 l / 3 cr 2 p / 2 cr				3+2	exam mid-semester grade
Materials and technology for microelectronics subject group								
Materials and technology for microelectronics (KV) *Csarnovics István*	:				3 l / 3 cr 2 p / 2 cr		3+2	exam mid-semester grade
Electronics subject group								
Analog and Applied Electronics (KV) *Zilizi Gyula*	.					2 l / 3 cr	3	exam
Digital Electronics (KV) *Zilizi Gyula*					2 l / 3 cr		3	exam
Applications of microcontrollers (KV) *Zilizi Gyula*					2 l / 2 cr		2	mid-semester grade
Computer simulation methods subject group								
Computer simulation methods (KV) *Kun Ferenc*					2 l / 2 cr 2 p / 2 cr		2+2	exam mid-semester grade
Special laboratory works subject group								
Atomic and nuclear physics laboratory work 2 (KV) *Csarnovics István*						2 p / 2 cr	2	mid-semester grade
Condensed Matter Lab. Practices 2 (KV) *Cserháti Csaba*						2 p / 2 cr	2	mid-semester grade
Statistical Data Analysis (KV) *Darai Judit*				2 l + 1 p / 4 cr			4	exam

Electron and atomic microscopy subject group								
Electron and atomic microscopy (KV) *Cserháti Csaba*				2 l / 3 cr			3	exam
Analythical spectroscopic methods (KV) *Csarnovics István*					2 l / 3 cr		3	exam
Environmental Physics subject group								
Environmental Physics 1 (KV) *Papp Zoltán*			2 l / 3 cr				3	exam
Nuclear measurement techniques subject group								
Nuclear measurement techniques (KV) *Papp Zoltán*						2 l / 3 cr 1 p / 1 cr	3+1	exam mid-semester grade
Programming subject group								
Programming (KV) *Dr. Kun Ferenc*			2 l / 2 cr 2 p / 2 cr				2+2	exam mid-semester grade
Computer Controlled Measurement and Process Control subject group								
Computer Controlled Measurement and Process Control (KV) *Oláh László*					4 p / 3 cr		3	mid-semester grade
Computer based measurement and process control (KV) *Zilizi Gyula*				2 l / 3 cr			3	exam
Vacuum science and technology subject group								
Vacuum science and technology (KV) *Daróczi Lajos*				2 p / 3 cr			3	exam
Modern analysis subject group								
Modern analysis (KV) *Novák-Gselmann Eszter*				2 l / 2 cr 2 p / 2 cr			3+2	exam mid-semester grade
Chemistry subject group								
Introduction to chemistry (KV) *Várnagy Katalin* *Herman Petra*	2 l / 2 cr	2 p / 2 cr					2+2	exam mid-semester grade
Thesis						10 cr.	10	mid-semester grade, final exam

Optional courses								
Optional courses **9** cr								
Classical Mechanics III. *Sailer Kornél*				2 l / 3 cr 2 p / 2 cr			3+2	exam mid-semester grade
Modern optics *Csarnovics István*					2 l / 3 cr		3	exam
Image processing in technical and medical applications *Cserháti Csaba*					2 l / 3 cr		3	exam
Environmental Physics 2 *Papp Zoltán*				2 l / 3 cr			3	exam

Work and Fire Safety Course

According to the Rules and Regulations of University of Debrecen a student has to complete the online course for work and fire safety. Registration for the course and completion are necessary for graduation. For MSc students the course is only necessary only if BSc diploma has been awarded outside of the University of Debrecen.
Registration in the Neptun system by the subject: MUNKAVEDELEM
Students have to read an online material until the end to get the signature on Neptun for the completion of the course. The link of the online course is available on webpage of the Faculty.

Internship

NO internship is required for students majoring in Physics BSc.

Physical Education

According to the Rules and Regulations of University of Debrecen a student has to complete Physical Education courses at least in two semesters during his/her Bachelor's training. Our University offers a wide range of facilities to complete them. Further information is available from the Sport Centre of the University, its website: http://sportsci.unideb.hu.

Pre-degree Certification

A pre-degree certificate is issued by the Faculty after completion of the bachelor's (BSc) program. The pre-degree certificate can be issued if the student has successfully completed the study and exam requirements as set out in the curriculum, the requirements relating to Physical Education as set out in Section 10 in Rules and Regulations – with the exception of preparing thesis – and gained the necessary credit points (180). The pre-degree certificate verifies (without any mention of assessment or grades) that the student has fulfilled all the necessary study and exam requirements defined in the curriculum and the requirements for Physical Education. Students who obtained the pre-degree certificate can submit the thesis and take the final exam.

Thesis

The preparation of the thesis is an independent professional activity that relies partly on the student's studies and partly on additional knowledge of the literature of the field and can be done under the guidance of a consultant for a single semester. Such professional activities may include processing the literature of a field; reproduction and processing of previous results, but it is not necessary to present a separate research work. Students will be informed about the formal requirements of the thesis upon acceptance of the application.

Final Exam

(a) requirements for admission to the final examination;
Only that student can take the Final Exam who has already obtained the required 180 credits, completed the language requirements and submitted his/her thesis.
(b) final examination;
The final examination consists of an oral part only and it is devoted to testing complex interrelationships of the professional knowledge of the student. The topics of the Final Exam are based on the content of professional core subjects. The thesis defence is a part of the Final Exam but can be kept separate in time. Calculation of exam results based on the Rules and Regulations. A final exam has to be taken in front of the Final Exam Board. If a candidate does not pass his/her final exam by the termination of his/her student status, he/she can take his/her final exam after the termination of the student status on any of the final exam days of the relevant academic year according to existing requirements on the rules of the final exam.

Final Exam Board
Board chair and its members are selected from the acknowledged internal and external experts of the professional field. Traditionally, it is the chair and in case of his/her absence or indisposition the vice-chair who will be called upon, as well. The board consists of – besides the chair – at least two members (one of them is an external expert), and questioners as required. The mandate of a Final Examination Board lasts for one year.

Repeating a failed Final Exam
If any part of the final exam is failed it can be repeated according to the rules and regulations. A final exam can be retaken in the forthcoming final exam period. If the Board qualified the Thesis unsatisfactory a student cannot take the final exam and he has to make a new thesis. A repeated final exam can be taken twice on each subject.

Diploma

The diploma is an official document decorated with the coat of arms of Hungary which verifies the successful completion of studies in the Physics Bachelor Program. It contains the following data: name of HEI (higher education institution); institutional identification number; serial number of diploma; name of diploma holder; date and place of his/her birth; level of qualification; training program; specialization; mode of attendance; place, day, month and year issued. Furthermore, it has to contain the rector's (or vice-rector's) original signature and the seal of HEI. The University keeps a record of the diplomas issued.

In Physics Bachelor Program the diploma grade is calculated as the average grade of the results of the followings:

- Weighted average of the overall studies at the program (A)
- Average of grades of the thesis and its defense given by the Final Exam Board (B)
- Average of the grades received at the Final Exam for the two subjects (C)

Diploma grade = (A + B + C)/3

Classification of the award on the bases of the calculated average:

Excellent	4.81 – 5.00
Very good	4.51 – 4.80
Good	3.51 – 4.50
Satisfactory	2.51 – 3.50
Pass	2.00 – 2.50

Course Descriptions of Physics BSc Program

Title of course: Mathematics in Physics **Code**: TTFBE0119	**ECTS Credit points:** 4
Type of teaching, contact hours - lecture: 1 hours/week - practice: 3 hours/week - laboratory: -	
Evaluation: signature + grade for written test	
Workload (estimated), divided into contact hours: - lecture: 14 hours - practice: 42 hours - laboratory: - - home assignment: 64 hours - preparation for the exam: - Total: 120 hours	
Year, semester: 1st year, 1st semester	
Its prerequisite(s): -	
Further courses built on it: TTFBE0101, TTFBG0101	
Topics of course	
Short repetition from secondary school knowledge: power and root identities, functions and function transformations, vectors. Limit value, differential and integral calculus, analysis of functions, differential equations. Mass point movement in single and multiple dimensions.	
Literature	
Compulsory: Moodle electronic notes *Recommended:* Bolyai-Books: Bárczy, Barnabás: Differential Calculus (Differenciálszámítás) Bárczy, Barnabás: Integral Calculus (Integrálszámítás)	
Person responsible for course: Prof. Dr. Zoltán Erdélyi, university professor, DSc	
Lecturer: Dr. Gábor Katona, PhD	

Title of course: Basics of measurement and evaluation **Code**: TTFBL0118	**ECTS Credit points:** 2
Type of teaching, contact hours - lecture: - - practice: 1 hours/week - laboratory: 1 hours/week	

Evaluation: mid-semester grade
Workload (estimated), divided into contact hours: - lecture: - - practice: 14 hours - laboratory: 14 hours - home assignment: 20 hours - preparation for the exam: 12 hours Total: 60 hours
Year, semester: 1st year, 1st semester
Its prerequisite(s): -
Further courses built on it: TTFBE0113, TTFBL0114

Topics of course
Documentation of measurements; measurement errors, uncertainties, standard deviation; graphical representation and evaluation; linear regression; linearization of non-linear formulas; least squares method; propagation of uncertainty
Literature
Compulsory: - *Recommended:* Handouts provided on the course home page

Person responsible for course: Dr. Gábor Katona, assistant professor, PhD
Lecturer: János Tomán, assistant lecturer

Title of course: Basic Environmental Sciences **Code**: TTTBE0040_EN	**ECTS Credit points: 1**
Type of teaching, contact hours - lecture: 1 hours/week - practice: - - laboratory: -	
Evaluation: exam	
Workload (estimated), divided into contact hours: - lecture: 14 hours - practice: - - laboratory: - - home assignment: - - preparation for the exam: 16 hours Total: 30 hours	
Year, semester: 2st year, 2st semester	
Its prerequisite(s): -	

Further courses built on it: -

Topics of course

What we call Environmental sciences. Natural values of the Earth, conservation of biodiversity. Effects of invasive species. Protection of habitats, prevention of species extinction. Short term and long term monitoring systems. Biomonitoring and MAB (Man and Biosphere programe). Fluvial and human transformed landscapes.

Literature

Compulsory:

H. Frances (2005): Global Environmental Issues. John Wiley & Sons, USA
ISBN: 978-0-470-09395-5

M. K. Wali, F. Evrendilek, M. S. Fennessy (2009): The Environment: Science, Issues, and Solutions. CRC Press ISBN: 9780849373879

J.M. Fryxell, A. R. E. Sinclair, G. Caughley (2014): Wildlife Ecology, Conservation, and Management. Wiley-Blackwell ISBN: 978-1-118-29106-1

Person responsible for course: Dr. Sándor Alex Nagy, associate professor, PhD

Lecturer: Dr. István Gyulai, assistant professor, PhD

Title of course: Introduction to Electronics **Code**: TTFBL0120	**ECTS Credit points:** 2

Type of teaching, contact hours
- lecture: -
- practice: -
- laboratory: 2 hours/week

Evaluation: practical grade

Workload (estimated), divided into contact hours:
- lecture: -
- practice: -
- laboratory: 28 hours
- home assignment: 32 hours
- preparation for the exam: -

Total: 60 hours

Year, semester: 3rd year, 1st semester

Its prerequisite(s): TTFBE1120

Further courses built on it: -

Topics of course

Laboratory work of performing electronic measurements of analog and digital circuits:
- Frequency resonance measurements on RLC circuits. Determination of resistance by Wheatstone bridge. Measurements on power supply circuits. Determination of the dependence of salt solution conductivity
- Analog electronics: Specification of operational amplifiers, basic op-amp circuits: inverting, non-inverting, summing and differential amplifiers, voltage-current converters, integrator, differentiator, oscillator circuit.

- Digital electronics: Logic gates; basic combinational logic circuits: encoders, decoders, binary adders; basic sequential logic circuits: memories, counters, shift registers, serial-parallel converter.

Literature

Compulsory:
- Oláh L.: Analog and digital electronics laboratory exercises, (laboratory textbook.)

Recommended:
- P. Horowitz: The art of electronics, Cambridge University Press, 1989

Person responsible for course: Dr. László Oláh, assistant professor, PhD

Lecturer: Dr. László Oláh, assistant professor, PhD

Title of course: Introduction to Electronics **Code**: TTFBL0120	**ECTS Credit points:** 2

Title of course: Mathematics 1. **Code**: TTMBE0810-EN	**ECTS Credit points**: 4
Type of teaching, contact hours - lecture: 4 hours/week - practice: - - laboratory: -	
Evaluation: exam	
Workload (estimated), divided into contact hours: - lecture: 56 - practice: - - laboratory: - - home assignment: 44 - preparation for the exam: 50 Total: 150	
Year, semester: 1st year, 1st semester	
Its prerequisite(s): -	
Further courses built on it: TTMBE0811_EN, TTMBG0811_EN	
Topics of course	
Sets. Real numbers. Complex numbers. Sequences and series. Convergence, limits. Real functions. Limit, continuity and differentiation of functions. Monotonicity, convexity, inflection. Approximation with polynomials, Taylor formula. Definition and calculation of definite, indefinite and improprius integrals. Ordinary differential equations. Vector spaces. Matrices, operations with matrices. Determinants and properties; the matrix rank. Linear equation systems. Euclidean spaces and their transformations.	
Literature	
Compulsory: - *Recommended:* 1. Thomas, Weir & Hass: Thomas' Calculus. 2. K. A. Stroud: Calculus and Mathematical Analysis. 3. K. A. Stroud: Engineering Mathematics. 4. E. Mendelson: Schaum's 3000 Solved Problems in Calculus.	
Person responsible for course: Dr. Zoltán Muzsnay, associate professor, PhD	
Lecturer: Dr. Zoltán Muzsnay, associate professor, PhD	

Title of course: Mathematics 1. **Code**: TTMBG0810-EN	**ECTS Credit points**: 2

- preparation for the exam: 31

Total: 90

Year, semester: 2nd year, 1st semester

Its prerequisite(s): TMBE0811 Mathematics 2.

Further courses built on it: -

Topics of course

Solving problems of: Differentiation of complex functions. The Cauchy-Riemann equations. Contour integral. Cauchy's integral theorem. Series representations of analytic functions. Power series. Laurent series. The residue theory. Spaces of integrable functions. Fourier series and its complex form. Bases in spaces of functions. Elements of functional analysis. Hilbert spaces. Linear forms and operators. Fourier transformation and applications. Laplace transformation and applications for investigation of differential equations.

Literature

Compulsory:
1. E.B. Saff, A.D. Snider: Fundamentals of Complex Analysis with Applications to Engineering and Science. Third Edition, Pearson Education, Inc. 2003.

Recommended:
1. W. Rudin: Functional analysis, Second Edition, McGraw-Hill, Inc. 1991.
2. F. Riesz-B. Sz.-Nagy: Functional Analysis, Dover Publications, Inc. 1990.

Person responsible for course: Dr. Ágota Figula, associate professor, PhD

Lecturer: Dr. Ágota Figula, associate professor, PhD

Title of course: Mathematics 3. **Code**: TTMBG0812-EN	**ECTS Credit points: 2**

Title of course: Linear algebra **Code**: TMMBE0815	**ECTS Credit points:** 3
Type of teaching, contact hours - lecture: 2 hours/week - practice: - - laboratory: -	
Evaluation: oral exam	
Workload (estimated), divided into contact hours: - lecture: 28 hours - practice: - - laboratory: - - home assignment: 34 hours - preparation for the exam: 28 hours Total: 90 hours	
Year, semester: 2nd year, 1st semester	
Its prerequisite(s): -	
Further courses built on it:	
Topics of course	
Basic notions in algebra. Determinants. Operations with matrices. Vector spaces, basis, dimension. Linear mappings. Transformation of basis and coordinates. The dimensions of the row space and the column space of matrices are equal. Sum and direct sum of subspaces. Factor spaces. Systems of linear equations. Matrix of a linear transformation. Operations with linear transformations.	

Similar matrices. Eigenvalues, eigenvectors. Characteristic polynomial. The existence of a basis consisting of eigenvectors. Linear forms, bilinear forms, quadratic forms. Inner product, Euclidean space. Inequalities in Euclidean spaces. Orthonormal bases. Gram-Schmidt orthogonalization method. Orthogonal complement of a subspace. Complex vectorspaces with inner product: unitary spaces. Linear forms, bilinear forms and inner products. Adjoint of a linear transformation. Properties of the adjoint transformation. Selfadjoint transformations. Isometric/orthogonal transformations. Normal transformations.
Literature
Paul R. Halmos: Finite dimensional vector spaces, Benediction Classics, Oxford, 2015. *Serge Lang, Linear Algebra, Springer Science & Business Media, 2013.* *Howard Anton and Chris Rorres, Elementary Linear Algebra, John Wiley & Sons, 2010*

- laboratory: -
- home assignment: 68 hours
- preparation for the exam: 56 hours

Total: 180 hours

Year, semester: 1st year, 1st semester

Its prerequisite(s): TTFBE0119, TTFBG0101

Further courses built on it: TTFBE0103, TTFBG0103

Topics of course

Law of inertia, definitions of inertial reference frame, point of inertia. Exparimental laws of two-body interactions. Definitions of mass and momentum, law of conservation of momentum. Definition of force. Newton's 3rd law. Force laws of elastic interaction and gravitation. Cavendish' experiment. Force laws of friction and drag. Coulomb, Lorentz and Van der Waals forces. Independence of forces. Law of dynamics

(Newton's 2nd law). Galilei's relativity principle. Solution of equation of motion for simple cases: motion in homogeneous gravitational field, ballistic motion, case of linear force law (spring). Damped oscillation. Solution of equation of motion for simple cases: forced oscillation, motion in case of central force, meaning and calculation of the 1st cosmic speed. Kepler's 1st law. Constrained motions, definition of constrain, discussion of mathematical pendulum. Kinetic and static friction, motion on a slope. Bulk and surface forces, definition of force density. Solution of equation of motion for simple cases: forced oscillation, motion in case of central force, meaning and calculation of the 1st cosmic speed. Kepler's 1st law. Constrained motions, definition of constrain, discussion of mathematical pendulum. Kinetic and static friction, motion on a slope. Bulk and surface forces, definition of force density. Generalization of Newton's laws for motion of extended bodies. Definition of mass density, Definition of current of momentum and energy. Derivation of the equation of motion of a raket and its solution. Law of dynamics in accelerating reference frames, definition of fictitious force. Fictitious forces on the rotating Earth. Kepler's 2nd law. Theorem of conservation of angular momentum for the motion of a point-like object. Definition of rotational inertia. Solution of the mathematical pendulum using the theorem of conservation of angular momentum. Angular momentum of a system of particles, generalization of the theorem of conservation of angular momentum. Computation and properties of rotational inertia of rigid bodies. Definition of angular momentum of rigid bodies with respect to an axis or a point. Conditions of equilibrium of rigid bodies. Equivalent substitution of weight. Discussion of rotation of a rigid body around a fixed axis: torsion pendulum, physical pendulum. Motion of a rigid body in a plane. Decomposition of angular momentum into orbital and rotational components and their respective equations of motion; roll. Classification and discussion of the motion of the spinning top. Classification of collisions. Solution of collision in one dimension. Definitions of kinetic energy and work, proof of work-energy theorem in the case of a particle. Definition of power. Derivation of the work-energy theorem in case of system of particles and rigid bodies in case of motion in a plane. Definition of potential energy. Law of conservation of mechanical energy. Definition of potential energy and computation of potential energy of an object in gravitational field. The 2nd cosmic speed. Kepler's 3rd law. Relation between potential energy and force law. Classification of equilibrium positions. Definition of gravitational field, computation of gravitational field of a sphere with homogeneous mass distribution. Equilibrium of elastic bodies. Definitions of tensile, shearing stresses and strains. Case of uniform compression. Definition of elastic potential energy density. Equilibrium of liquids and gases, Pascal's laws, definition of hydrostatic pressure, law of Archimedes. Law of Boyle and Mariotte. Air pressure, barometric formula. Classification of flows. Equation of continuity. Bernoulli's equation and its applications. Friction in liquids: viscous flow and Newton's law of viscosity. Laminar flow in a tube. Turbulent flow. Drag formula. Classification of elastic waves. Speed of waves, definition of the wave function, wave equation in one dimension. Energy transport in moving elastic waves. Wave function of and energy relations in moving sinusoidal waves. Reflection of waves in one dimension from the boundary of the medium. Wave function of standing waves and energy relations in them. Wave in two and three dimensions: wave functions, wave equations, interference, diffraction and refraction of waves. Principle of Huygens and Fresnel. Doppler's effect. Physical characterization of perception of sound. Definition of the decibel unit. Wave of light. Speed of light. Principle of special relativity. Lorentz transformations.

Literature

Compulsory:

- Zoltán Trócsányi: Classical mechanics, lecture note in electronic format

Recommended:

- Robert Resnick, David Halliday, Keneth S. Krane, Physics I: Chapters 1-21 John Wiley & Sons, Inc.

Person responsible for course: Dr. István Nándori, associate professor, PhD

Lecturer: Dr. István Nándori, associate professor, PhD

Title of course: Classical mechanics I class work **Code**: TTFBG0101	**ECTS Credit points:** 4
Type of teaching, contact hours - lecture: - - practice: 2 hours/week - laboratory: -	
Evaluation: signature + grade for written test	
Workload (estimated), divided into contact hours: - lecture: - - practice: 28 hours - laboratory: - - home assignment: 92 hours - preparation for the exam: - Total: 120 hours	
Year, semester: 1st year, 1st semester	
Its prerequisite(s): TTFBE0101	
Further courses built on it: -	

Topics of course

Problems of collisions of point-like object in one and two dimensions using conservation of momentum and Newtons's 3rd law. Application of Newtons's 2nd law to simple cases of force laws: spring, gravitational and central force problems. Solution of the equation of motion with constraints: mathematical pendulum, motion on inclined plane, motion in presence of friction. Solution of the equation of motion with constraints: mathematical pendulum, motion on inclined plane, motion in presence of friction. Finding the center of mass of rigid bodies in simple cases. Applications of Newtons's 2nd law of motion in accelerating reference frames. Application of the angular momentum theorem; calculation of the angular momentum of rigid bodies with respect to a fixed axis and to a fixed reference point. Calculation of the moment of inertia of rigid bodies in simple cases; Steiner's theorem. Problems for static equilibrium of rigid bodies, dynamics of rigid bodies rotating about a fixed axis, calculation of orbital and spin angular momentum. Rolling motion. Application of the work-energy theorem in simple cases. Calculation of the kinetic and the potential energy; problems for application of conservation of mechanical energy. Calculation of the potential energy for various force laws. Problems related to the second cosmic velocity; calculation of the elastic stress, the equivalent spring constant and Young's modulus. Problems of static equilibrium of gases and liquids (hydrostatics and aerostatics). Applications of Pascal's laws, hydrostatic pressure, Archimedes law, Boyle–Mariotte law, barometric formula. Problems for fluid mechanics: continuity equation, Bernoulli equation, Newton law of viscosity. Solution of problems of waves: wave speed, wave function, wave equation, energy types and their relations in traveling and standing waves. Doppler formula. Application of Lorentz' transformation formulas and their kinematical consequences in solving problems of relativistic kinematics.

Literature

Compulsory: Robert Resnick, David Halliday, Keneth S. Krane, Physics I: Chapters 1-21 John Wiley & Sons, Inc.. *Recommended:* -
Person responsible for course: Dr. István Nándori, associate professor, PhD
Lecturer: Dr. István Nándori, associate professor, PhD

Title of course: Computer basics for physics applications **Code**: TTFBE0113	**ECTS Credit points:** 2

Type of teaching, contact hours
- lecture: 1 hours/week
- practice: -
- laboratory: 2 hours/week

Evaluation: exam

Workload (estimated), divided into contact hours:
- lecture: 14 hours
- practice: -
- laboratory: 28 hours
- home assignment: 8 hours
- preparation for the exam: 10 hours

Total: 60 hours

Year, semester: 1st year, 2nd semester

Its prerequisite(s): TTFBE0101, TTFBL0118

Further courses built on it: -

Topics of course

Getting familiar with the working principles of Excel, understanding the relative and absolute cell coordinates, use of R1C1 view. Use of tables, objects, functions. Plotting data sets, applying statistical analysis, use of data-analysing and equation solving extensions. Application of WolframAlpha, Scilab and other mathematical softwares to solve mathematical problems. Matrix algebra, numerical derivation, numerical integration, interpolation, histogram. Solving simple physics problems with the computer.

Literature

Compulsory:
- Written materials uploaded to the Moodle learning platform,
- Engineering with Excel, 4th Edition by Ronald W. Larsen; Pearson, 2013,
- Scilab for very Beginners by Scilab Enterprises, 2013

Recommended:
- Introduction to Scilab by Scilab Enterprises, 2010

Person responsible for course: János Tomán, assistant lecturer

Lecturer: János Tomán, assistant lecturer

Title of course: Laboratory practical: mechanics, optics, thermodynamics 1 **Code**: TTFBL0114	**ECTS Credit points:** 2

Type of teaching, contact hours
- lecture: -
- practice:
- laboratory: 2 hours/week (aggregated as 4hours/week)

Evaluation: mid-semester grade

Workload (estimated), divided into contact hours:

- lecture: -
- practice:
- laboratory: 20 hours
- home assignment: 40 hours
- preparation for the exam: -

Total: 60 hours

Year, semester: 1st year, 2nd semester

Its prerequisite(s): TTFBE0101 and TTFBL0118

Further courses built on it: TTFBL0115

Topics of course

Laboratory measurements in mechanics, thermodynamics and optics: Measurements with pendulums, Elastic moduli, Measurements with sound waves, Refractive index and dispersion, Measurements with lenses

Literature

Compulsory:
Handouts provided on the course home page
Recommended:
Any university textbook on the topic of the upcoming measurement

Person responsible for course: Dr. Gábor Katona, assistant professor, PhD

Lecturer: Dr. László Tóth, assistant professor, PhD
Dr. Eszter Baradács, associate professor, PhD

Title of course: Laboratory practical: mechanics, optics, thermodynamics 2 **Code**: TTFBL0115	**ECTS Credit points:** 2

Evaluation: exam

Workload (estimated), divided into contact hours:
- lecture: 56 hours
- practice: -
- laboratory: -
- home assignment: 68 hours
- preparation for the exam: 56 hours

Total: 180 hours

Year, semester: 1st year, 2nd semester

Its prerequisite(s): TTFBE0101, TTFBE0813, TTFBG0102

Further courses built on it: **TTFBE0103**

Topics of course

Thermal equilibrium, empirical temperature scales. Laws of Gay and Lussac, introduction of the the ideal-gas scale. State variables, equations of state for gases (in ideal-gas and Van der Waals approximations), condensed matter, elastic spring. Experimental observations leading to the recognition of the atomic structure of matter: Dalton's laws, Avogadro's law. Amount of substance. Characteristic size of a molecule. Brown-motion. Potential energy of the molecular interaction, concept of surface tension and surface energy. Relation between surface curvature and pressure, contact angle, capillarity. Statement of the 1st law of thermodynamics; interpretation of internal energy, ordered and disordered means of energy transfer. General concept of temperature. Finding the dependence of internal energy on state variables: friction calorimeter, heat capacity, specific heat. Mixing calorimeter; Dulong-Petit rule. Enthalpy, specific heat at constant pressure. Finding the dependence of the internal energy of gases on state variables, flow calorimeter. Free expansion on throttling; dependence of the enthalpy of gases on state variables. Internal energy of the ideal gas. Quasi-static adiabatic change of state, adiabatic lines of the ideal gas. Kinetic model of gases, kinetic interpretation of pressure and temperature. Law of equipartition, understanding the values of molar heat capacities of gases on the bases of equipartition. Freeze-out of degrees of freedom in gases. Molar heat capacity of condensed matter. Probability distribution and its density function. Maxwell-distribution of velocity components and magnitude. Stern's experiment. Distribution of concentration of gas in force field, barometric formula. Energy distribution of oscillators with continuous and discrete energy, interpretation of the freeze out of degrees of freedom based on the quantum assumption. Planck's formula and other quantum assumptions. Reversible and irreversible processes. The concept of heat engines. Ideal Joule-engine, thermal efficiency, rate of energy loss. Heat engines of Clausius-, Otto-, Diesel-type. Refrigerators. Ideal Carnot-engine, reversible engine. Stirling-engine. Concept of perpetual engine of the 2nd kind. Phenomenological formulation of the 2nd law of thermodynamics. Definition of the thermodynamic temperature scale. Simulation game to describe mixing; notion of macro and micro states. Statistical fluctuation. Simulation of energy distribution in the Einstein-model of condensed matter. Statistical formulation of the 2nd law. Statistical temperature and statistical entropy. Maximum efficiency of heat engines, relation between the statistical and thermodynamic temperature, thermodynamic entropy. Adiabatic quasi-static (constant entropy) process. Computation of the change of entropy from macroscopic parameters. Formulation of the 2nd law to certain processes of open systems, free energy and free enthalpy. Various formulations of the 1st law for reversible processes of homogeneous substances. Use of the equation of state to derive the dependence of the internal energy on state variable. Phase transitions, equilibrium of phases; phase transition temperature and latent heat. Liquid-vapour isotherms, evaporation and boiling. Sublimation, phase diagram, triple point. Change of entropy in phase transitions, chemical potential. Equation of Clausius and Clapeyron. Critical temperature, liquefying gases, condensation refrigerators. Liquefying gases of low critical temperature. Multicomponent systems, mixing entropy. Free enthalpy of solvents with low concentration, decrease of freezing, increase boiling temperatures. Transport phenomena. Current and current density. Convective and conductive transport. Operation of the vapour turbine. Mean free path and cross section. Stationary diffusion, Fick's law. Derivation of Fick's law using gas kinetics. Conductive heat transfer, Fourier's law. Viscosity, Newton's law of viscosity.
Literature
Recommended: - Robert Resnick, David Halliday, Keneth S. Krane, Physics I: Chapters 22-26 John Wiley & Sons, Inc.

Person responsible for course: Prof. Dr. Zoltán Trócsányi, university professor, DSc, member of HAS
Lecturer: Dr. Gábor Katona, PhD, assistant professor

Topics of course

Use of temperature scales and state equations to solve problems. Use of curvature pressure, interface energy and contact angle to calculate equilibrium fluid level. Problems to calculate changes in internal energy. Problems to calculate the enthalpy change, applying the quasi-static adiabatic state change equations. Application of the probability density function to solve problems. Calculating the efficiency of the Otto- and Diesel-cycle processes, the coefficent of performance of refrigerators. Problems for calculating macro and micro states. Problems to determine entropy change from macroscopic data. Problems to calculate free energy and free enthalpy. Applying Clausius-Clapeyron equation to solve tasks. Problems to use the mean free path and Fick's law. Applying law of heat conduction (Fourier's law) to solve tasks.

Literature

Robert Resnick, David Halliday, Keneth S. Krane, Fundamentals of Physics, John Wiley & Sons, Inc.

Person responsible for course: Dr. Darai Judit, associate professor, PhD

Lecturer: Dr László Tóth, PhD, assistant professor

Title of course: Classical mechanics 2 **Code**: TTFBE0104	**ECTS Credit points:** 3
Type of teaching, contact hours - lecture: 2 hours/week - practice: - - laboratory: -	
Evaluation: exam	
Workload (estimated), divided into contact hours: - lecture: 28 hours - practice: - - laboratory: - - home assignment: - - preparation for the exam: 62 hours Total: 90 hours	
Year, semester: 1st year, 2nd semester	
Its prerequisite(s): TTFBE0101, TTFBG0104, TTMBE0815	
Further courses built on it: -	

Topics of course
Kinematics of system of particles and contiuous systems. Waves. Generalized coordinates and constraints. Periodic waves. Linear superposition and interference. Physical state. The principle of least action. Lagrange's equations, and the uniqueness of the solution. Newton's first law. Coordinate transformations (spatial translation and rotation, time translation, Galilean transformation). Symmetries. Galilean relativity. Space inversion and time reversal symmetries. Lagrange functions (free particle, free system of particles, generalized potential energy). Pair potential, interaction with external fields. Lagrange's equation of the first kind, method of Lagrange multipliers. Symmetries and conservation laws. Noether's theorem. Momentum, angular momentum, conservation of energy. Conservation of the center of mass. Momentum, angular momentum, energy in laboratory systems and in center of mass systems. Newton's second law (forces), law of action and reaction, conservation theorem for the linear momentum of a system of particles. Equilibrium in mechanics. Closed systems and mechanically closed systems. Work-energy theorem. Potential energy, conservative forces, fields, equipotential surfaces, force lines. Energy conservation. Energy balance, types of work done. Motion of free particles, drag, frictions. One dimensional motion of a particle in external potential (bound states, scattering states, turning points), potential wells and barriers. Harmonic oscillator, damped harmonic oscillator, driven harmonic oscillator, over- and undercritical damping, resonance. Pendulum. Hamilton equations of motion, Legendre transform. Continuous systems as a system of coupled harmonic oscillators. Infinitesimal strain theory, deformation tensor. Stress tensor, Hooke's law, static deformations of

continuous systems. Ideal fluid flow, Euler equations, classification of flows. Viscous fluids. Navier-Stokes equations.
Literature
Compulsory: H. Goldstein, C. Poole, J. Safko, Classical Mechanics (Addison Wesley, 2001) *Recommended:*-

Person responsible for course: Dr. Sandor Nagy, associate professor, PhD
Lecturer: Prof. Dr. Kornel Sailer, professor emeritus, DSc

Title of course: Classical mechanics 2 class work **Code**: TTFBG0104	**ECTS Credit points:** 3
Type of teaching, contact hours - lecture: - - practice: 2 hours/week - laboratory: -	
Evaluation: signature + grade for written test	
Workload (estimated), divided into contact hours: - lecture: - - practice: 28 hours - laboratory: - - home assignment: 62 hours - preparation for the exam: - Total: 90 hours	
Year, semester: 1st year, 2nd semester	
Its prerequisite(s): TTFBG0104, TTMBE0813	
Further courses built on it: -	
Topics of course	
Problems related to circular motion, solution of the harmonic oscillator, simple problems with composition of harmonic motions. Wave motion, wave equations, and their solutions. Calculations with Lagrange functions of simple systems. Constraints, problems related to Lagrange's equation of the first kind. Derivation of momentum, angular momentum, energy from the Lagrange function, continuous symmetries and conservation laws, conservation of the center of mass. Problems related to potential energies and conservative forces. Motion of particle in a potential. Investigation of the harmonic oscillator, damped oscillator, driven oscillator. Usage of Hamilton equations of motion, and Legendre transform. Problems related to deformation of bodies.	
Literature	
Compulsory:	

H. Goldstein, C. Poole, J. Safko, Classical Mechanics (Addison Wesley, 2001) *Recommended:*-
Person responsible for course: Dr. Sandor Nagy, associate professor, PhD, habil
Lecturer: Prof. Dr. Kornel Sailer, professor emeritus, DSc

Title of course: Optics **Code**: TTFBE0103	**ECTS Credit points:** 1
Type of teaching, contact hours - lecture: 1 hours/week - practice: - - laboratory: -	
Evaluation: exam	
Workload (estimated), divided into contact hours: - lecture: 14 hours - practice: - - laboratory: - - home assignment: 6 hours - preparation for the exam: 10 hours Total: 30 hours	
Year, semester: 1[rt] year, 2[nd] semester	
Its prerequisite(s): TTFBE0101	
Further courses built on it: -	
Topics of course	
Light rays and waves. The speed of light. The nature and propagation of light. The terminology of photometry. Basic laws of geometrical optics: superposition of waves, interference diffractions, absorption, scattering. Thin lenses, thick lenses, spherical mirrors. Mirror and lenses defects. Optical devices: camera, microscope, eye, lope. Main phenomena of physical optics: interference, coherence. Interference on double shit. Establish the main elements of the interference. Intensity dispersion in the case of two slit experiment. Interference in thin layers, Newtonian rings. Interferometers: Michelson, the coherence of laser source, holography. Diffraction, Huygens-Fresnel law, Fresnel diffraction, Fraunhofer diffraction. The conditions of diffraction. Interference and diffraction on two slit. Optical gratings, their parameters, and terminology. Diffraction and reflection on particles. X-ray diffraction and their application. The polarization of light. The parameters and terminology of polarization. Brewster law and Fresnel equation. Double refraction. Optical filters, linear polarized light. Elliptically polarized light. Interference of polarized light. Optical activity. The polarization of reflected light. Resolution of optical devices.	
Literature	
Compulsory:	

1. Eugene Hecht, Optics, 5th edition, Pearson education, 2016. 2. Francis A. Jenkins, Harvey E. White, Fundamentals of Optics, McGraw-HillPrimis Custom Publishing, 2001
Person responsible for course: Dr. István Csarnovics, assistant professor, PhD
Lecturer: Dr. István Csarnovics, assistant professor, PhD

Topics of course
Basic concepts and phenomena of electrostatics. Electric charge, force between charges. Coulomb's law. Electric charge and matter. The concept of electric field. Gauss's law. The basic characteristics of the static electric field: Electrostatic potential. The electric dipole moment, the electric field of a system of charges, the principle of superposition. Conductors and insulators. The distribution of electric charge on an isolated conductor, corona discharge. Capacitance and capacitors. Energy density of the electrostatic field. Dielectrics, electric polarization, susceptibility, displacement vector. Electric current and electric resistance, current density. Resistivity and conductivity. Ohm's law and Joule's law. The microscopic view of the electronic conduction in solids. Electronic circuits, the electromotive force. Kirchhoff's rules, an RC circuit. The mechanism of the electronic conduction of liquids and gases. The concept of the magnetic field and the definition of magnetic field inductance vector. Magnetic force acting on a current or a moving charge. The magnetic field induced by a current or a moving charge Biot–Savart's and Amper's law. Magnetic properties of matter. Dia-, para- and ferromagnetic materials. An atomic view of the magnetism of matter, the Einstein de Haas experiment. Motion of charged particles in electric and magnetic field. Mass spectrometers and particle accelerators. The Hall effect. Faradays law of induction. Lenz's rule. The properties of the induced electric field. Self-induction. RL circuits, mutual induction. Energy stored in the magnetic field. Electromagnetic oscillations. Free and damped oscillations in LC and RLC circuits, forced oscillations, coupled oscillations,

resonance. Alternating current circuits. Motors and generators, the transformer. The three phase alternating current. The concept of displacement current and induced magnetic field. The Ampere-Maxwell law. Maxwell's equations in differential and integral forms. Potentials and the wave equation. Electromagnetic waves. Dipole radiation, electromagnetic plane waves. Energy and momentum in the electromagnetic radiation.

Literature

Compulsory:
Robert Resnick, David Halliday, Keneth S. Krane, Physics Volume 2, John Wiley & Sons, Inc.

Topics of course

Electrical and magnetic basic quantities. Maxwell equations in vacuum (differential and integral forms). Maxwell equations in macroscopic media. Boundary conditions. Continuity equation. Relaxation time. Completeness of Maxwell equations. Energy and momentum of the electromagnetic field. Poynting vector. Ponderomotive forces. Electromagnetic potentials in homogeneous isotropic insulators and conductors. Gauge transformations. Lorentz and Coulomb gauges. Electrostatics. Poisson and Laplace equations. Boundary value problems in electrostatics. Potential created by a static charge distribution. Electric field of conducting sphere. Point charge in the presence of a grounded conducting sphere. Dipole moments. Polarization of dielectric. Magnetostatics. Direct currents (DC). Basic equations. Ohm's law. Kirchhoff's laws. Law of Biot and Savart. Electromagnetic induction. Basic equations of the electromagnetic field. Alternating currents (AC). RL circuit. RLC circuit. Calculation of scalar and vector potentials. Basic equations of rapidly changing electromagnetic fields. D'Alembert's equation. Telegrapher's equations. Electromagnetic waves. Solutions of the wave equation. Retarded potentials. Electromagnetic waves in homogeneous isotropic insulators. Point dipole and antenna radiation. Electromagnetic waves in homogeneous, isotropic conductors. Cavities.

Literature

Compulsory:
- Jackson: Classical Electrodynamics (WILE&SONS, 1985).

Recommended:

Its prerequisite(s): TTFBE0102, TTFBE0103

Further courses built on it: TTFBG0106

Topics of course

Bondings: atomic structure, binding forces and binding energy, primary bonds (ionic, covalent, metallic), secondary bonds (van der Waals, hydrogen). Crystal lattices: unit cells, crystalline structure of metals, crystalline systems and crystal types (primitive, bcc, fcc, hcp), crystallographic points, directions, Miller indices, linear and planar atomic density, close packing, single crystals, polycrystalline materials, bases of diffraction. Crystal faults: most important crystal faults, interstitial atom, vacancy, edge and screw dislocation, alloy, solid solution, phase and grain boundary. Diffusion: Definition and basic laws of diffusion, steady state diffusion equation, and its solution under simple initial conditions, time-dependent diffusion equation, and its solution in simple initial and boundary conditions. Elastic materials: elastic characteristics of the material, Hooke's law, relationship between elasticity constants, stress-strain diagram, yield strength, tensile strength, hardness, tangential form of Hooke's law for isotropic substances. Dislocation and deformation, deformation: characterization of dislocations, sliding planes, slip plane in single and polycrystalline material, deformation with twinning, increase of material strength, re-crystallization. Ceramics and polymers: structure of ceramics, silicates and glasses, crystalline defects and diffusion in ceramics, elastic properties of ceramics; polymeric molecules (molecular weight, shape, structure, configuration), thermoplastic and thermosetting polymers, copolymers, crystalline polymers, mechanical properties of polymers. Magnetic properties: the basic concepts of magnetism, the relationship between magnetism and material structure, dia, para, ferro, ferrite and antiferro magnetism, the effect of temperature on magnetic materials (Curie and Neel temperature), magnetic domains. Modern material testing and characterization methods: optical and scanning electron microscopes (transmission and scanning electron microscopy, scanning probe microscopes) and their various modes, X-ray diffractometry. Phase diagrams: solubility limit, phases, microstructure, phase balance, single and isomorph binary-phase diagrams, eutectic alloys, Gibbs phase rule, phase sequence, intermediate phases, compound phases.

Literature

Topics of course
The students During the 4-hour laboratory work, the students get acquainted with the measurements from the subject of condensed materials to enhance their practical knowledge in the subject. During the course, four of the following eight measurements must be selected by the student: Determining the temperature dependence of magnetism, measuring coercive force and hysteresis. Measurement of hardness and tensile strength. The basics of differential thermal analysis. Testing the temperature dependence of electrical resistance. Diffusion measurement in liquid phase. Measuring Barkhausen noise
Literature
Compulsory: There are instructions of 10-20 pages produced by the Institute. *Recommended:* -

Person responsible for course: Dr. Csaba Cserháti, associate professor, PhD
Lecturer: Dr. Petra Pál, Dr. László Tóth

Topics of course

Wave properties of light: refraction, diffraction and interference, Young's two-slit diffraction experiment. Quantum aspects of light: electromagnetic radiation (spectral radiance), Reyleigh-Jeans' law, Planck's law. Quantum aspects of light: application of Planck's law and its consequences. Interpretation of Wien's and Stefan-Boltzmann's laws. Direct observation of the quantum properties of light: photo effect, Compton scattering. X-ray diffraction, the Bragg's law. De-Broglie hypothesis of matter waves. Discovery of the electron. Davisson-Germer experiment. Rutherford 's experiment. Cross section of Rutherford scattering. Discovery of the atomic nucleus. Derivation of the differential cross section formula of Rutherford scattering on point-like and extended target. Atomic spectra of Hydrogen-like atoms. Rydberg-Balmer formula. Bohr's postulates. Correspondence principle and the energy levels of the electron inside the atom. Franck-Hertz experiment. Fine structure of the atomic spectra. Effects of magnetic field on the atomic spectra (Zeeman splitting, Larmor-frequency) and electric field on the atomic spectra (Stark effect). Einstein - de Haas experiment, Stern-Gerlach experiment and the spin angular momentum the electron. Characteristic X-ray radiation, induced radiation, lasers. The periodic table of elements. Basics of quantum mechanics: states and measurements. Spin - state vector representation. Spin - density matrix representation.

Literature

Compulsory:
- Zoltán Trócsányi: Atomic and quantum physics, lecture note in electronic format

Recommended:
- Robert Resnick, David Halliday, Keneth S. Krane, Physics II: Chapters 45-54 John Wiley & Sons, Inc.

Person responsible for course: Dr. István Nándori, associate professor, PhD

Lecturer: Dr. István Nándori, associate professor, PhD

Title of course: Atomic and quantum physics class work **Code**: TTFBG0107	**ECTS Credit points:** 2
Type of teaching, contact hours - lecture: - - practice: 1 hours/week - laboratory: -

Topics of course

Problems on refraction and interference. Problems on electromagnetic radiation (spectral radiance) and the application of Wien's and Stefan-Boltzmann's laws. Application of Planck's law. Problems on the photo effect and Compton's scattering. Application of Bragg's law and de-Broglie's hypothesis of matter waves. Determination of the trajectory of the alpha particle in case of Rutherford's scattering. Calculation of the differential cross section. Application of the Rydberg-Balmer formula. Solution of the Landau-Lifshitz-Gilbert equation for static applied magnetic field. Application of Zeeman's splitting formula. Problems on characteristic X-ray radiation and the application of Moseley's law. Understanding of inverse population and negative temperature. Problems related to the periodic table of elements. Simple quantum mechanical problems. Problems related to the spin.

Evaluation: signature + exam
Workload (estimated), divided into contact hours: - lecture: 28 hours - practice: 14 hours - laboratory: - - home assignment: 38 hours - preparation for the exam: 40 hours Total: 120 hours
Year, semester: 3rd year, 1st semester
Its prerequisite(s): TTFBE0107
Further courses built on it: TTFBL0117,

Topics of course
Discovery of radioactivity. The characteristics of alpha decay, the Geiger-Nuttal rule, the fine structure of the spectrum. Interpretation with the tunnel effect. The concept of parity, parity violation, the universal weak interaction. Electromagnetic transitions of the nucleus. Transitional probabilities, isomeric states, internal conversion, Mössbauer effect. Essential properties of the nucleus. Size, charge, mass and binding energy, electromagnetic multipole momentum. Nuclear reactions, cross section, conservation laws. Compound nucleus model. Direct reactions, the optical model. Fission, neutron slowing down and diffusion, nuclear chain reaction, fission reactors. Termonuclear reactions, fusion devices. Excited states of the nucleus, one particle and collective excitations, giant multipole resonances. Nuclear models: liquid drop, shell, Fermi gas models. Nuclear forces, phenomenological approximation, the deuteron. The role of meson in the interpretation of nuclear forces. Results of low and high energy scattering experiments.
Literature
B. L. Cohen: Concepts of Nuclear Physics (McGraw-Hill, 1971)

Person responsible for course: Dr. Darai Judit, associate professor, PhD
Lecturer: Dr. Krasznahorkay Attila, scientific advisor

Title of course: Atom and nuclear physics laboratory work 1 **Code**: TTFBL0117-EN	**ECTS Credit points:** 2
Type of teaching, contact hours - lecture: -	

- practice: -
- laboratory: 2 hours/week

Evaluation: mid-semester grade

Workload (estimated), divided into contact hours:
- lecture: -
- practice: -
- laboratory: 28 hours
- home assignment: 32 hours
- preparation for the exam: -

Total: 60 hours

Year, semester: 3rd year, 1st semester

Its prerequisite(s): TTFBE0106-EN, TTFBE0107-EN

Further courses built on it: -

Topics of course

The spectra of atoms and molecules. Optical filters. Application of optical gratings and prisms. The h/e ratio. The Stefan-Boltzmann law. The Wien law.
Calibration and measurements with nuclear physics detectors. Characteristics of the gas and scintillation detectors. Nuclear decays and their properties, production of alpha, beta and gamma particles.

Literature

Compulsory:
1. Ujvári Balázs – Laboratory work – Nuclear Physics.
2. Csarnovics István – Laboratory works - Atom physics and optics.

Person responsible for course: Dr. Balázs Ujvári, assistant professor, PhD

Lecturer: Dr. István Csarnovics, assistant professor, PhD,
Dr. Balázs Ujvári, assistant professor, PhD.

Title of course: Quantum mechanics **Code**: TTFBE0110	**ECTS Credit points:** 4

Type of teaching, contact hours
- lecture: 3 hours/week
- practice: -
- laboratory: -

Evaluation: oral examination

Workload (estimated), divided into contact hours:
- lecture: 42 hours

- practice: -
- laboratory: -
- home assignment: 42 hours
- preparation for the exam: 56 hours

Total: 150 hours

Year, semester: 3rd year, 1st semester

Its prerequisite(s): TTFBE0104, TTFBE0107, TTFBG0110

Further courses built on it: -

Topics of course

Experiments that lead to quantum mechanics, the Stern-Gerlach experiment. Introduction of the quantum mechanical state, ket space, bar space, operators. Base kets and matrix representation. The physical quantites as operators. Measurement, observables, and uncertainty relations. Operators with continuous spectra, position, translation, momentum. Wave function. Introduction of the time evolution, Schrödinger equation, stationary states. Schrödinger picture, Heisenberg picture. Introduction of the Heisenberg equation of motion, free particles, Ehrenfest theorem. The harmonic oscillator, and its time evolution. Wave mechanics, continuity equation. Infinitesimal and finite rotations in quantum mechanics. Rotation in spin 1⁄2 systems. Euler rotation. Density operator, ensemble averages, pure and mixed ensembles, time evolution of ensembles. Angular momentum operator, eigenvaues, eigenvectors. Orbital angular momentum, spherical harmonics. The hidrogen atom. Entangled states, EPR paradox, Bell's inequality. Continuous and discrete symmetries. Identical particles, Pauli exclusion principle. Periodic table.

Literature

Compulsory:

J. J. Sakurai, Modern Quantum Mechanics (Addison-Wesley, 2011)

Recommended:

-

Person responsible for course: Dr. Sándor Nagy, associate professor, PhD

Lecturer: Dr. Sándor Nagy, associate professor, PhD

Title of course: Quantum mechanics, class work **Code**: TTFBG0104	**ECTS Credit points:** 3

Type of teaching, contact hours
- lecture: -
- practice: 2 hours/week
- laboratory: -

Evaluation: mid-semester grade

Workload (estimated), divided into contact hours:
- lecture: -

- practice: 28 hours
- laboratory: -
- home assignment: 62 hours
- preparation for the exam: -

Total: 90 hours

Year, semester: 3rd year, 1st semester

Its prerequisite(s): TTFBE0110

Further courses built on it: -

Topics of course

Properties of the Hilbert space. The ket and the bra space, reprezentation of operators, operators acting on states. Observables, operators, uncertainty principle. Properties of operators of continuous spectra, examples, position, momentum. Solution of the Schrödinger equation for free particles and for simple potential forms. Usage of the Heisenberg equation of motion for free particles and for position dependent potentials. Problems related to the harmonic oscillator, eigenvalues, eigenvectors, selection rules. Solving problems in connection with rotations. Examples for pure and mixed states. Properties of the angular momentum operator. Problems related to the orbital angular momentum and the spherical harmonics. Problems related to the hydrogen atom, selection rules. Operators acting on entangled states. Calculation of expectation values for the Bell inequality.

Literature

Compulsory:

J. J. Sakurai, Modern Quantum Mechanics (Addison-Wesley, 2011)

Recommended:

-

Person responsible for course: Dr. Sándor Nagy, associate professor, PhD

Lecturer: Dr. Sándor Nagy, associate professor, PhD

Title of course: Fundamental interactions **Code**: TTFBE0121	**ECTS Credit points:** 5

Type of teaching, contact hours
- lecture: 2 hours/week
- practice: 2 hours/week
- laboratory: -

Evaluation: exam

Workload (estimated), divided into contact hours:
- lecture: 28 hours
- practice: 28 hours

- laboratory: -
- home assignment: 70 hours
- preparation for the exam: 54 hours

Total: 180 hours

Year, semester: 3rd year, 2nd semester

Its prerequisite(s): TTFBE0110

Further courses built on it: -

Topics of course

Four fundamental interactions and their force carriers. Classifications of elementary and compound particles, and their properties (lifetime, mass, charge, spin, parity). Conservation laws: electric charge, lepton and barion numbers, angular momentum, conservation of energy and momenta in four-vector formalism and its usage in particle scattering processes. Introduction to Classical Field Theory based on the model of linear chain of coupled oscillators. Lagrangian formalism for Classical Field Theory, the principle of least action. Symmetries in Classical Field Theory, the Noether-theorem. Internal symmetries and their relation to fundamental interactions. Quark model and the standard model of elementary particles; particle families. Beta-decay. Properties of neutrinos. Discovery of neutrino oscillations. Measurement of luminosity, distance and velocity of celestial bodies of the Universe. The cosmologic principle, the Hubble-expansion and the critical Universe. Friedmann-equations and their solutions. Discovery of cosmic microwave background radiation, the interpretation of its origin and its properties. Barionic acoustic oscillations and the distances of SN1 supernovae. Inflationary cosmology.

Literature

Compulsory:

- István Nándori, Zoltán Trócsányi: Fundamental Interactions, lecture note in electronic format

Recommended:

- Leon M. Lederman: The God Particle: If the Universe Is the Answer What is the Question? ISBN 0-385-31211-3
- Horváth Dezső, Trócsányi Zoltán: Introduction into particle physics, electronic textbook.

Person responsible for course: Dr. István Nándori, associate professor, PhD

Lecturer: Dr. István Nándori, associate professor, PhD

Title of course: Statistical Physics **Code**: TTFBE0216	**ECTS Credit points:** 5

Type of teaching, contact hours

- lecture: 3 hours/week
- practice: -
- laboratory: -

Evaluation: exam

Workload (estimated), divided into contact hours:

- lecture: 42 hours
- practice: -
- laboratory: -
- home assignment: 60 hours
- preparation for the exam: 48 hours

Total: 150 hours

Year, semester: 3rd year, 2nd semester

Its prerequisite(s): -

Further courses built on it:-

Topics of course

Goal of statistical physics, importance of statistical description. Basic notions and relations of the theory of probability.

Micro- and macro-states. Classical mechanics of many-particle systems: phase point, phase space, trajectory. Hamiltonian dynamics. Canonical transformations. Liouville theorem.

The measure and features of information, the missing information, unbiased estimates. Shannon's information entropy, the maximum entropy principle. Entropy of many particle systems of classical mechanics. Fundamental postulates of statistical physics. Direction of macroscopic processes.

Derivation of multi-variable functions. Constraints, conditional extreme value calculations of two- and multi-variable functions. Lagrange multiplicators and their physical interpretation. Legendre-transforms.

Statistical equilibrium, statistical ensembles. Conditions of equilibrium, equilibrium of closed systems. Statistical averages, ensemble average, time average, ergodicity hypothesis. Density of states. Density of states of classical and quantum mechanical systems.

Micro-canonical ensemble, phase density, partition function and entropy. Extensive and intensive quantities, thermodynamic relations. Canonical ensemble. Canonical phase density, internal energy and entropy. Canonical temperature. Relation of free energy and internal energy. Probability density of the energy of the system, energy fluctuations and their dependence on the system size. Thermal equilibrium. Equivalence of micro-canonical and canonical ensembles. Thermodynamic quantities. Macro-canonical ensemble. Phase density and partition function of macro-canonical ensemble. Probability distribution of the particle number, particle number fluctuations and their dependence on the system size. Chemical potential. T-p ensembles. Equivalence of statistical ensembles in the thermodynamic limit.

Thermodynamic potentials from the energy and from the entropy. Quasi-static processes, pressure, work, heat, first law of thermodynamics. Second and third laws of thermodynamics.

Canonical ensemble of the classical ideal gas, partition function, equation of state. Probability distribution of the velocity and energy of particles, the Maxwell-Boltzmann distribution. Quantum ideal gases, relation of classical and quantum mechanical descriptions. Quantum statistics, bosons and fermions. Degenerate Fermi-gas. Degenerate Bose-gas, Bose-Einstein condensation. Properties of Bose-Einstein condensates. Specific heat of solids. Degenerate free-electron gas. Classical limits of quantum statistics.

Literature

Compulsory:
- R. Kubo, Statistical mechanics with examples (The University of Tokyo, 1982).
- L.E. Reichl, A modern course in statistical physics (Wiley, New York, 2010).
- K. Huang, Statistical Mechanics (Wiley, New York, 1998).

Recommended:
- R. H. Swendsen, An Introduction to Statistical Mechanics and Thermodynamics (Oxford University Press, 2012).

Person responsible for course: Prof. Dr. Kun Ferenc, university professor, DSc

Lecturer: Prof. Dr. Kun Ferenc, university professor, DSc

Title of course: Statistical Physics **Code**: TTFBG0216	**ECTS Credit points:** 3

Type of teaching, contact hours
- lecture: -
- practice: 2 hours/week
- laboratory: -

Evaluation: mid-semester grade

Workload (estimated), divided into contact hours:
- lecture: -
- practice: 28 hours
- laboratory: -
- home assignment: 36 hours
- preparation for the tests: 26 hours

Total: 90 hours

Year, semester: 3rd year, 2nd semester

Its prerequisite(s): -

Further courses built on it:-

Topics of course

Basic relations of probability theory. Discrete and continuous stochastic variables.

Classical mechanics description of many-particle systems, Hamiltonian dynamics. Canonical transformations. Phase space volume, phase space density, Liouville theorem on simple examples.

The measure and properties of information, the missing information, unbiased estimates. Shannon's information entropy, the maximum entropy principle. Entropy of discrete and continuous stochastic variables. Entropy of classical mechanical systems through examples.

Derivation of multi-variable functions. Constraints, conditional extreme value calculus of two- and multi-variable functions. Lagrange-multiplicators and their physical interpretation. Legendre-transforms.

Number of micro-states, density of states and its properties. Density of states of classical and quantum mechanical systems illustrated by examples.

Application of the micro-canonical ensemble to fundamental model systems of statistical physics. Derivation of thermodynamic relations. Application of the canonical ensemble to fundamental models of statistical physics. Probability distributions of physical quantities in the canonical ensemble. Energy distribution, fluctuations of energy and its dependence on the system size. Temperature, thermal equilibrium. Derivation of thermodynamic relations. Equivalence of the canonical and micro-canonical ensembles. Application of the grand-canonical ensemble to fundamental models of statistical physics. Distribution of particle, fluctuation of the particle number and its dependence on the system size. Chemical potential, equilibrium. T-p ensembles, derivation of thermodynamic potentials.

Canonical ensemble of the classical ideal gas, partition function, equation of state. Probability distribution of the velocity and energy of particles, the Maxwell-Boltzmann distribution. Quantum ideal gases, relation of classical and quantum mechanical descriptions. Quantum statistics, bosons and fermions. Degenerate Fermi-gas. Degenerate Bose-gas, Bose-Einstein condensation. Properties of Bose-Einstein condensates. Specific heat of solids. Degenerate free-electron gas. Classical limits of quantum statistics.

Literature

Compulsory:

Topics of course

The main materials for electronics, their classification, and properties. Metals, semiconductors and dielectric material. Crystalline and amorphous materials. Band structures, optical and electrical conductivity. P-n junction. Main types of semiconductors and their technology. Si and Ge, organic semiconductors, their main properties, and parameters. Vacuum technology and basic elements. Thin layer technology, main deposition techniques: evaporation, deposition. Investigation of thin

layers. The technology of single crystals, amorphous materials. The technology of Si and GaAs from bottom to the top. Diffusion, implantation and another lithography. The technology of active and passive elements, diodes, transistors, circuits. The technology of optoelectronic elements and devices: light sources and solar cells. SMT and THM technology of PCB. Quality, reliability. Some peculiar applications: sensors, memory elements, functional electronics, mechatronics. Trends in the development of micro- and nanotechnology. At the laboratory, students deal with thin film technology, thin film measurements, lithography, design, and fabrication of PCBs.
Literature

Total: 120 hours

Year, semester: 2^{nd} year, 2^{nd} semester

Its prerequisite(s): TTMBE0818

Further courses built on it: -

Topics of course

Elements of probability theory: the concept of probability, random variables, probability density functions. Distributions: binomial and multinomial, Poisson, uniform, exponential, Gaussian, lognormal, chi-square distributions. Error propagation. General concepts of parameter estimation: sample, statistics, estimator, consistency, parameter fitting, sampling distribution, bias, mean squared error, sample mean, weak law of large numbers, sample variance. The Monte Carlo method and its applications: generation of a sequence of uniformly distributed random numbers, the multiplicative linear congruential algorithm, the transformation method, the acceptance-rejection method, Monte Carlo integration, applications. Statistical tests: hypotheses, test statistics, critical region, acceptance region, significance level, errors of the first and the second kind. Example with particle selection. Constructing a test statistic, linear test statistics, the Fisher discriminant function. Goodness-of-fit tests, P-value, observed significance (confidence) level. The significance of an observed signal. Pearson's chi-square test. The method of maximum likelihood: the likelihood function, estimating the values of the parameters of a density function with the method of maximum likelihood. Examples: exponential and Gaussian distributions. Variance of ML estimators: analytic method, Monte Carlo method, the Rao-Cramer-Frechet (RCF) (or information) inequality, efficient estimator, graphical method. Example of the method of maximum likelihood with two parameters. The method of least squares: connection with maximum likelihood. Linear least-squares fit. The variance of the estimated parameters.
The method of moments. Characteristic functions and their applications.

Numerical methods. Errors, error sources. Nonlinear equations: fixed-point iteration, Newton-Raphson method,
false position method. Two-equation systems: fixed-point iteration, Newton-Raphson method, gradient method. Algebraic equations: Horner scheme, Vieta theorem, Lobacsevszkij-Graeffe method. Solution of systems of linear equations: Gauss-elimination, iteration, advantages, disadvantages. Weakly determined systems of equations, geometric demonstration. Numerical integration: general formula, trapezoid formula, Simpson-formula. Numerical integration of differential equations: the basic problem and its generalizations, Euler method, Taylor method.

Literature

Glen Cowan: Statistical data analysis (Clarendon press, Oxford, 1998)
W.H. Press et al.: Numerical Recipes (Cambridge University Press, 2007.)

Person responsible for course: Dr. Darai Judit, associate professor, PhD

- preparation for the exam: 28 hours

Total: 90 hours

Year, semester: 1st year, 1st semester

Its prerequisite(s):

Further courses built on it: TTFBE0103, TTFBE0105, TTFBE0106

Topics of course

During the semester, students will learn about the theoretical and practical basics of scanning electron microscopy (SEM) and electron beam (EPMA) microanalysis, as well as transmission electron microscopy (TEM) and electron diffraction (ED). Discuss the operation of the equipment, the interaction of the electron beam and the sample material, the ways of detecting the resulting signals, the electron diffraction phenomena, and the basics of imaging. We present the principles of qualitative and quantitative x-ray analysis and the preparation of microscopic samples. The basics of image processing and image analysis essential to the interpretation of microscopic images are also part of the course. In addition, other equipments such as SPM and AFM will be discussed. The students are going to use of the equipment during the course.

Topics of course

The meaning of environmental physics, the place and role of environmental physics among the sciences. The environment as part of the universe in space and time. Physical impacts of extraterrestrial origin in the environment (effects of extragalactic and galactic origin, effects of the Sun, Moon and other objects of the Solar System). Physical impacts of earthly origin in the environment (Earth's origin and evolution, effects deriving from the Earth's planetary nature, Earth's internal structure, its thermal energy, gravity and magnetic field). The basics and environmental consequences of the earth's crust physics (plate tectonics, mountain formation, volcanism, earthquakes, erosion, rock and soil physics). The basics and environmental consequences of natural water physics (physical properties of water, energy and material transport of environmental waters, the physics of oceans, seas, rivers, lakes, groundwater and ice). The basics and environmental consequences of atmospheric physics (vertical and horizontal structure of atmosphere, energy balance of the Earth-atmosphere system and the atmosphere, greenhouse effect, ozone shielding, weather phenomena, atmospheric electrification and light phenomena, atmospheric material transport and aerosols, spatial distribution of climates, global climatic system, time changes of climate).

Literature

Compulsory:
- Z. Papp (2018): pdf copies of the PowerPoint presentations with the filenames EnvPhys-1-1 to EnvPhys-1-14

- laboratory: -

Evaluation: exam

Workload (estimated), divided into contact hours:
- lecture: 28 hours
- practice: -
- laboratory: -
- home assignment: -
- preparation for the exam: 62 hours

Total: 90 hours

Year, semester: 3rd year, 2nd semester

Its prerequisite(s): TTFBE0107, (k) TTFBL0213

Further courses built on it: -

Topics of course

The meaning and basic function of nuclear measurement technology. The main properties of the nuclear and other ionizing radiations to be tested, their interaction with matter. Relevant concepts and quantities related to the detection of ionizing radiation and the measurement of the properties and quantities of ionizing radiation. Various types of measuring instruments that can be used to test ionizing radiation, principles and details of their operation (gas-filled detectors, scintillation detectors, semiconductor detectors, other detector types). Electronic auxiliaries serving the operation of measuring instruments (nuclear electronics). Measurement methods for the determination of the quantities of radionuclides or stable nuclides in material samples: alpha, beta and gamma spectrometry, mass spectrometry, activation analysis.

Literature

Compulsory:

- Z. Papp (2018), the PowerPoint presentations with the filenames NuclMeasTech-1 to NuclMeasTech-6

Recommended:

- K. Siegbahn, Alpha-, Beta- and Gamma Spectroscopy, North-Holland Publishing Company, Amsterdam, 1965
- G. F. Knoll, Radiation Detection and Measurement, John Wiley and Sons, New York, 1979
- A Handbook of Radioactivity Measurement Procedures, NCRP Report No. 58, NCRP, Bethesda, 1994
- W. B. Mann et al., Radioactivity Measurements. Principles and Practice, Pergamon Press, Oxford, 1988 (Appl. Radiat. Isot. Vol. 39, No. 8)

Person responsible for course: Dr. Zoltán Papp, associate professor, PhD

Lecturer: Dr. Zoltán Papp, associate professor, PhD

Title of course: Nuclear measurement techniques laboratory **Code**: TTFBL0213	**ECTS Credit points:** 1

Type of teaching, contact hours

- lecture: -
- practice: -
- laboratory: 16 hours/semester

Evaluation: grade for written laboratory record

Workload (estimated), divided into contact hours:

- lecture: -
- practice: -
- laboratory: 16 (4x4) hours
- home assignment: 14 hours
- preparation for the exam: -

Total: 30 hours

Year, semester: 3rd year, 2nd semester
Its prerequisite(s): (p) TTFBE0213
Further courses built on it: -

Topics of course
Determination of the range in the air and energy of alpha radiation using a variable pressure measuring chamber and a semiconductor detector. Examination of self-absorption of beta-radiation using Geiger-Müller counter. Study of the backscattering of beta-radiation from matter using Geiger-Müller counter. Determination of the range and energy of beta-radiation based on the measurement of the absorption curve using Geiger-Müller counter.
Literature
Compulsory: - E. Bleuler and G. J. Goldsmith, Experimental Nucleonics, Rinehart & Company, Inc., New York, 1952 *Recommended:* - K. Siegbahn, Alpha-, Beta- and Gamma Spectroscopy, North-Holland Publishing Company, Amsterdam, 1965 - G. F. Knoll, Radiation Detection and Measurement, John Wiley and Sons, New York, 1979 - A Handbook of Radioactivity Measurement Procedures, NCRP Report No. 58, NCRP, Bethesda, 1994 - W. B. Mann et al., Radioactivity Measurements. Principles and Practice, Pergamon Press, Oxford, 1988 (Appl. Radiat. Isot. Vol. 39, No. 8)

Person responsible for course: Dr. Zoltán Papp, associate professor, PhD
Instructor: Dr. Eszter Baradács, assistant professor, PhD

Title of course: Programming **Code**: TTFBE0617	**ECTS Credit points:** 2
Type of teaching, contact hours - lecture: 2 hours/week - practice: - - laboratory: -	
Evaluation: exam	
Workload (estimated), divided into contact hours: - lecture: 28 hours - practice: - - laboratory: - - home assignment: 17 hours - preparation for the exam: 15 hours	

Total: 60 hours
Year, semester: 2nd year, 1st semester
Its prerequisite(s): -
Further courses built on it:-

Topics of course
Programming languages; methodology of program development; basics of algorithmic problem solving; most important algorithms. Data structures and computer representation of data. Construction of a C program; structured programming. Data types of the C language, declaration and initialization of variables. Functions of standard input and output. Library functions of mathematics. Evaluation of expressions in the C language. Control of the program flow; conditional statements. Loop commands. Array as a derived data type; processing arrays with loop commands. File operations. High level and bit level logical operators. Definition and declaration of functions. Generic structure of C functions. Passing parameters by value and by address. Function calls.
Literature
Compulsory: B. W. Kernigan and D. M. Ritchie, The C programming language (Prentice Hall, 2007). J. R. Hanly and E. B. Koffmann, Problem Solving and Program Design in C (7th Edition), (Pearson, 2004). *Recommended:* P. van der Linden, Expert C Programming: Deep C Secrets, (SunSoft Press, 1994).

Person responsible for course: Prof. Dr. Kun Ferenc, university professor, DSc
Lecturer: Prof. Dr. Kun Ferenc, university professor, DSc

Title of course: Programming **Code**: TTFBL0617	**ECTS Credit points:** 2
Type of teaching, contact hours - lecture: - - practice: 2 hours/week - laboratory: -	
Evaluation: mid-semester grade	
Workload (estimated), divided into contact hours: - lecture: - - practice: 28 hours - laboratory: - - home assignment: 20 hours - preparation for the tests: 12 hours	

Total: 60 hours

Year, semester: 2nd year, 1st semester

Its prerequisite(s): -

Lecturer: Prof. Dr. Kun Ferenc, university professor, DSc

Title of course: Vacuum science and technology I **Code**: TTFBE0209	**ECTS Credit points:** 3

Type of teaching, contact hours

- lecture: 2 hours/week
- practice: -
- laboratory: -

Evaluation: exam

Workload (estimated), divided into contact hours:

- lecture: 28 hours
- practice: -
- laboratory: -
- home assignment: -
- preparation for the exam: 62 hours

Total: 90 hours

Year, semester: 2^{nd} year, 2^{nd} semester
Its prerequisite(s): thermodynamics, electromagnetism
Further courses built on it: -

Topics of course

The brief history of the vacuum science, the role and importance of the vacuum technology in the modern science and industry. The most important physical quantities in the vacum physics. The fundamentals of the kinetic theory of gases average mean free path, pressure, velocity and energy of particles, transport phenomena in low pressure gases: diffusion, internal friction, heat conduction. Flow in gases; viscous flow, molecular flow, flow trough diaphragms and tubes, throughput, pump speed, calculation of pumping time. Surface phenomena; adsorption, desorption, absorption, evaporation, sublimation, permeation. Vacuum gauges; mechanical gauges, thermocuple and Pirani gauges, ionization gauges, calibration of vacuummeters. Mass spectrometers; magnetic, quadropole and time of flight spectrometers. Vacuum leak detection. Vacuum pumps; mechanical pumps, diffusion pumps, ejector pumps, turbomolecular pumps, sorption pumps, getter pumps, ion-getter pumps, cryopumps. Materials of vacuum technology; structural materials, sealants, lubricants, pump fluids. Thin film deposition techniques; vacuum evaporation, sputtering, molecular beam epitaxy, chemical vapour deposition, atomic layer deposition. Design of vacuum systems, components, accesories.

Literature

Compulsory:
N. Yoshimura: Vacuum technology: practice for scientific instruments, Springer (2008)
Umrath: Fundamentals of Vacuum Technology, 1998
Recommended
:D.J Hucknall: Vacuum Technology and Applications, Butterworth-Heinemann Ltd. 1991
R.V. Stuart: Vacuum Technology, Thin Films and Sputtering, Academic Press (1983)
R. Ekman, J. Silberring, A. Westman-Brinkmalm,A. Kraj: Mass Sspectrometry, Wiley (2009)

Person responsible for course: Dr. Lajos Daróczi, associate professor, PhD

Lecturer: Dr. Lajos Daróczi, associate professor, PhD

Title of course: Modern analysis **Code**: TTMBE0816	**ECTS Credit points: 3**
Type of teaching, contact hours - lecture: 2 hours/week - practice: - - laboratory: -	
Evaluation: exam	
Workload (estimated), divided into contact hours: - lecture: 28 hours - practice: - - laboratory: - - home assignment: 34 hours - preparation for the exam: 28 hours Total: 90 hours	
Year, semester: 2^{nd} year, 2^{nd} semester	
Its prerequisite(s): TTMBE0814	

Further courses built on it: -
Topics of course
Differentiability of complex functions. Curve integral, Cauchy's integral theorem. Taylor series and Laurent series. The residue theorem. Metric spaces, compactness, completeness, separability. The Hahn--Banach theorem. Bounded linear maps. Banach spaces, Hilbert spaces, Gram--Schmidt ortogonalization. Complete orthonormal systems. Fourier series, Riesz representation theorem. Self-adjoint, normal, unitary and compact operators. Spectral theory for compact operators.Fredholm and Volterra type integral operators. Banach algebras, spectrum, resolvent, Gelfand—Mazur theorem. The elements and applications of the continuous functional calculus.The mathematical foundations of quantum mechanics.
Literature
Compulsory: - *Recommended:* - Rudin, Walter Real and complex analysis. Third edition. *McGraw-Hill Book Co., New York,* 1987. xiv+416 pp. ISBN: 0-07-054234-1 - Rudin, Walter Functional analysis. Second edition. International Series in Pure and Applied Mathematics. *McGraw-Hill, Inc., New York,* 1991. xviii+424 pp. ISBN: 0-07-054236-8 - Kolmogorov, A. N.; Fomin, S. V. Elements of the theory of functions and functional analysis. Vol. 2: Measure. The Lebesgue integral. Hilbert space. Translated from the first (1960) Russian ed. by Hyman Kamel and Horace Komm *Graylock Press, Albany, N.Y.* 1961 ix+128 pp. - Lang, Serge Complex analysis. Fourth edition. Graduate Texts in Mathematics, 103. *Springer-Verlag, New York,* 1999. xiv+485 pp. ISBN: 0-387-98592-1 - von Neumann, John Mathematical foundations of quantum mechanics. New edition of Translated from the German and with a preface by Robert T. Beyer. Edited and with a preface by Nicholas A. Wheeler. *Princeton University Press, Princeton, NJ,* 2018. xviii+304 pp. ISBN: 978-0-691-17857-8; 978-0-691-17856-1
Person responsible for course: Dr. Eszter Novák-Gselmann, associate professor, PhD
Lecturer: Dr. Eszter Novák-Gselmann, associate professor, PhD
